

Aakash Business ERP

Logic Audit - Round 16

What was checked, compared with other ERPs and fixed

Edition: 29 September 2026

Contents

1. Stock value of purchases
2. Controls
3. Registers and reconciliation
4. Checked and found in order
5. Observations left as they are

What was checked, how it compares with Tally, Busy, Marg, Zoho Books and Microsoft Dynamics NAV / Business Central, what was wrong and what was changed. Each fix has a server test (**r22-r26**) and, where old data was affected, a migration (145-147).

1. Stock value of purchases

Area	Before	Other ERPs	Now
Purchase GRN / direct Bill stock cost	Entry rate stored as the cost of one base unit. A line in boxes (1 box = 12 pcs) at 1200/box valued each piece at 1200 - 12x over. Discount and non-VAT terms (freight on the bill) never reached the stock value.	Tally / Busy: item value = amount of the line after discount + additional cost apportioned. NAV: unit cost (LCY) per base unit incl. line discount and item charges.	Cost per base unit = the line's share of the document's goods value without VAT (the same figure the purchase account gets) / qty in base units (utils/purchaseStockCost.js). Purchase Return uses the same rule.
Additional expense (freight, customs, insurance ...)	Allocated to the purchase lines (purchase_expense_allocations) but never added to the stock value.	Tally "additional cost of purchase", Busy "landed cost", NAV item charges: go into the cost of the goods.	Posting an additional expense adds its allocated amount to the cost of the stock receipt of that line (GRN, direct Bill, or the GRN a Bill line came from; an Order line is split over the GRN / Bill lines made from it). Cancelling takes it out again. stock_movements.base_unit_cost keeps the cost without landed cost.
Production output / by-products	Cost stored per entered unit against a base-unit qty.	Per base unit.	Total cost / base qty.
Sales return into stock	Came back at the selling rate - margin went into stock value.	Tally / Busy: at cost; NAV: exact cost reversal of the original shipment.	Customer returns come back at the cost that batch / serial went out at, else the current average (stock engine ignores the selling rate on a return).
Services, non-inventory items, fixed assets on bills	Wrote stock movements: a service sold made "negative stock", a computer bought through a purchase bill became closing stock.	Not inventory in any of them.	No stock movement for Item Type service / non_inventory / fixed_asset; the negative-stock check skips them (utils/stockItems.js). Migration 147 removes such movements (open years only).

2. Controls

Area	Before	Other ERPs	Now
Closed fiscal year	Closing a year only set a flag; documents dated in it could still be posted, cancelled or re-posted - the closed Trial Balance could change.	NAV "Allow Posting From / To", Tally / Busy year lock.	Database trigger (migration 146): no GL batch or stock movement can be added to or removed from a closed / locked year, whatever module tries.
Negative stock	Checked only by Sales Delivery, Stock Transfer and Stock Adjustment, one line at a time.	Tally / Busy "negative stock: warn / block" on every outward voucher.	One rule (utils/negativeStock.js) also on direct Sales Bill and Purchase Return; lines of the same item / warehouse / batch are added up; base units.
"Post anyway?" and credit override	The server sent warnings / credit_blocked , but the client dropped every extra field of an error - the Sales Delivery "post anyway" prompt and the credit-limit override could never appear.	-	authFetch keeps the server's extra fields on the error; Sales Bill, Purchase Return and every entry saved through the fill bar ask "Post anyway?" when stock is short.
Supplier bill no	Could be entered twice for the same supplier - purchase and VAT credit booked twice.	NAV: Vendor Invoice No. must be unique per vendor; Tally / Busy warn.	Refused on save and on posting (another non-cancelled bill of the same supplier with the same number, ignoring case / spaces).

3. Registers and reconciliation

- Sales / Purchase VAT Register: one-click books - Sales Book (bills + JV
- Reconciliation (Accounts Report > VAT, TDS & IRD): VAT, Sales Account,
- Account confirmation letter: purchases from / sales to the party in the

4. Checked and found in order

- Every GL batch balances - enforced by the database (migration 45,
- All 124 menu entries lead to a page; every API path used by the client
- Stock transfer cost per base unit; stock adjustment cost = amount / base
- Poultry, hatchery, construction and automobile post only through the

5. Observations left as they are

- Automobile vehicle delivery can be saved without a Sales Bill; the sale is
- Additional expense posted after the goods were sold: the landed cost goes
- Migrations 138-147 have to be run on the live database; 145-147 also
